Assignment_week11

Task 1

Proof by induction for the factorial function.

Inductive start:

It's given that f(1) = 1.

Inductive step:

If f(n-1) is correct then $n \cdot f(n-1)$ must be correct, since: $n! = n \cdot (n-1)!$.

If we now use recursion, we will eventually hit $n \cdot f(1)$, we know f(1) is correct, thus it will be correct for every step before.
